The T18SZ Model Data Converter is software that converts model data for T18MZ to that for T18SZ. The software cannot convert model data made by other transmitters such as T14MZ etc. Thus please still use the existing converter - Futaba Model Data Converter Ver.1.0.4, if you want to convert model data for T14MZ/FX-40/T12Z/T12FG/FX-30.

Prior to using the Model Data Converter software, please ensure that your transmitter is utilizing the latest update for the respective transmitter. Also, be sure to select the desired conversion data in transmitter after it has been updated.

**Important: Always check the operation of the model prior to flight.**

1. Preparation ........................................................................................................... P2
2. Select the Source of the Data ............................................................................. P2
3. Select the Intended Location for the Converted Data ....................................... P3
4. Detailed setting .................................................................................................... P4
5. Data conversion .................................................................................................. P6
6. Precautions and warnings .................................................................................. P7
7. Error Message .................................................................................................... P8
1. Preparation

1.1. Please make sure that the card reader is attached to the PC prior to inserting the memory card.

1.2. After ensuring that the memory card of the original transmitter contains the model to be converted, place the memory card in the card reader which is attached to your PC. You can utilize the same memory card to save the data.

1.3. Please run the Model Data Converter. To do so, click the Model Data Converter executable.

2. Select the Source of the Data

2.1. Click the "…” button in the “Convert from” group box.

2.2. The “Browse for Folder” dialog, as shown below, will appear. Please select the directory and/or folder in which the model data is saved and click the "OK" button.
2.3. The list of the saved model data from this card will be displayed in the Transmitter, Model Name, Model Type and Date columns in the “Convert from” group box. Select the desired conversion data from this list.

(Note) If the "Model name" text box in the "Convert to" block is blank, the selected model data name is input into this "Model name" text box automatically.

(Note) If a name is already input into the text box, it will be changed to reflect the model data name which has been selected in the "Convert from" group box.

3. Select the Intended Location for the Converted Data

3.1. Click the "..." button of the "Convert to" group box and select the respective folder or directory designation. Once you are satisfied with the selection, click the "OK" button.
3.2. Click on the "Model name" text box. Using the PC’s keyboard, enter a new name for the model. Please note: this will be the name displayed in the "Model name" columns of the "Convert to" group box when the data is converted.

4. Detailed setting

It is possible to change the "condition name", "dual rate name", and "hardware assignment" during the data conversion.

If you do not desire to make these changes, it is not necessary to follow the steps in this section.

4.1. Click the "Detail" button in the "Convert to" group box.
4.2. Click the "OK" button after you have read the information in the dialog box which appears.

4.3. The "Detail" dialogue is displayed. If you are satisfied with the detailed settings, click the "OK" button. To make refinements to this information, please refer to the information below contained in the Condition Name, Dual rate Name and Substitute Hardware function sections.

[Condition Name]
* Please input the new condition name into the text box of the respective editing condition.
* If you click the "Reset" button of the "Condition name" block, and select "Yes" in the confirmation dialog, the condition names are initialized using the name of the conditions from the original data.
* If you click the "Set to default" button of the "Condition name" block, and select "Yes" in the confirmation dialog, the condition names are initialized in an abbreviated form with only eight (8) characters. For example, "CONDIT1" rather than "Condition 1".
[Substitute hardware function]

* The Futaba Model Data Converter can substitute hardware if the intended transmitter is not equipped with the same items. For example, if the source code transmitter utilized an "RST" designation, the converted data may be replaced by "RS" if the destination transmitter does not utilize the "RST" designation but uses "RS" instead.

* If the intended transmitter does not utilize the same hardware, the initial value of the hardware is set to NULL.

* The substitution of switch hardware and the linear hardware is not possible.
  - Switch hardware …SW-A, SW-B, SW-C, SW-D, SW-E, SW-F, SW-G, SW-H
  - Linear hardware …LD, RD, LS, RS, J1, J2, J3, J4, T1, T2, T3, T4, T5, T6

---

5. Data conversion

5.1. Click the "Convert" button.

5.2. If successful a dialog box, as shown below, will appear. Please click the "OK" button.
5.3. Depending upon the source and destination transmitter models, a warning dialog might appear. Read the information in the dialog box prior to clicking the "OK" button. Additionally, we suggest that you check the operation of the model prior to flight.

![Warning dialog box]

### 6. Precautions and warnings

- Telemetry setting data are not converted by the converter.
- The Box/Hysteresys setting of the hardware is canceled.
- The nested logic switch is set to NULL.
- All logic switches except the "Condition Select" are set to NULL.
- The Linear/VTR/Spline curve is changed to a point curve.
- The combination setting is set to Single mode unless it is set in all Condition to Group.
- The setting of "Fuel Mixture" and "Multi Engine" are initialized.
